

# The power-2 limb darkening law

Implementation and confrontation with observations

Dr Pierre Maxted  
Keele University, Staffordshire, UK

# CHEOPS and pycheops

- ESA S-class mission to detect/characterise exoplanet transits
- 32-cm telescope, low-Earth orbit, 400-1000nm bandpass
  - 150 ppm/min for V~9 star
- Launch 15th Oct — 14th Nov 2019.
- 20% of time for guest observers
- Open-source data analysis tools
  - *\$ pip install pycheops*

# Power-2 limb darkening law

$$I_{\lambda}(\mu) = 1 - c(1 - \mu^{\alpha})$$

Morello et al. 2017

« recommend the use of ...

“power-2”, which outperforms

other two-coefficient laws ...

particularly for cool stars »

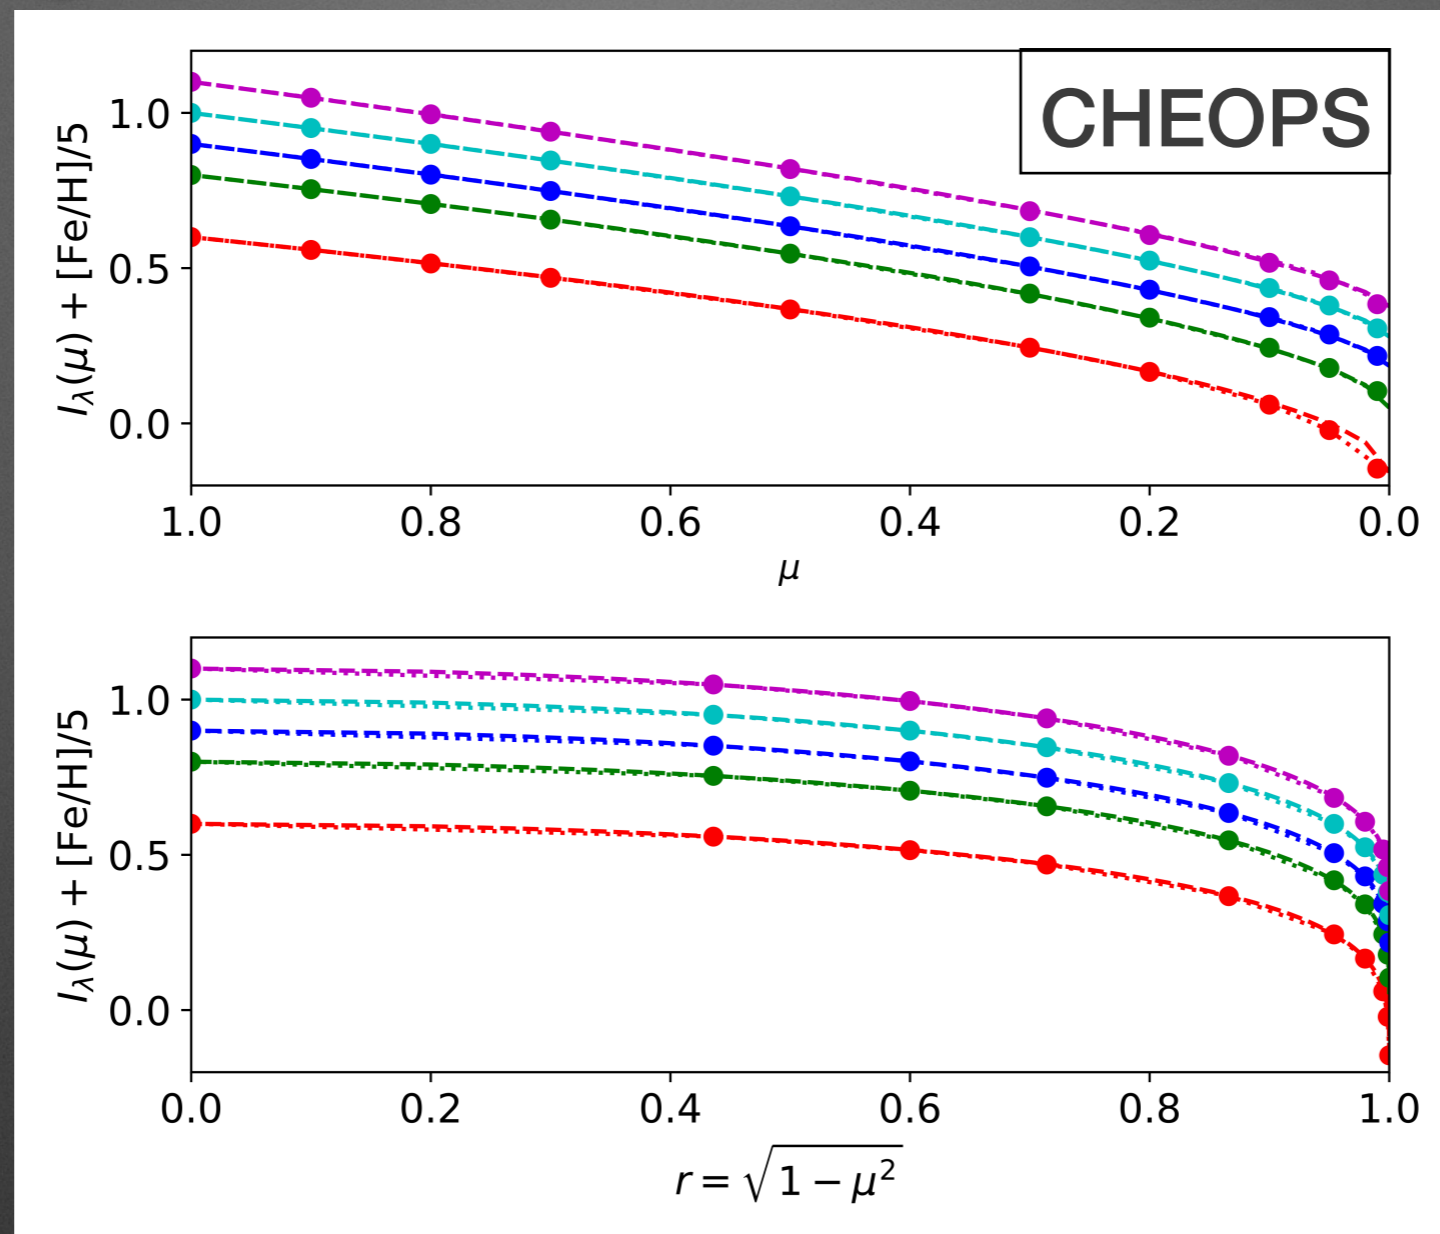

# Putting power-2 into pycheops

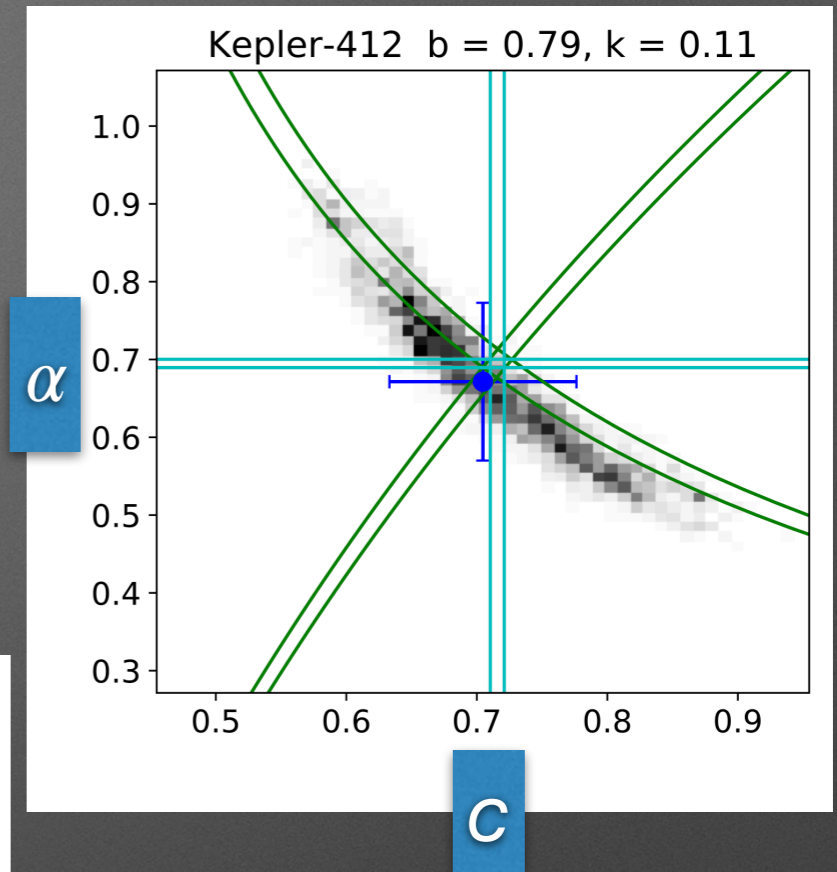

- Points computed directly from models
  - $T_{\text{eff}}=5777$ ,  $\log g= 4.44$ ,  $[\text{Fe}/\text{H}] = -2, -1, -0.5, 0.0, +0.5$
- Dotted lines are interpolated profiles
- Dashed lines show power-2 law for interpolated  $c$ ,  $\alpha$  values

# Observed power-2 law parameters

- Kepler DR25 SC light curves for transiting exoplanets
- Model with  $e11c$
- Include  $c$  and  $\alpha$  as free parameters

# Comparing theory and observations

- $h_1 = I_\lambda(1/2)$
- $h_2 = I_\lambda(1/2) - I_\lambda(0)$

- $h_1 = 1 - c(1 - 1/2^\alpha)$
- $h_2 = 1/2^\alpha c$

# Power-2 law — model v. observations

$$\langle \Delta h_1 \rangle = +0.010 \pm 0.002 \quad (\sigma = 0.011)$$

$$\langle \Delta h_2 \rangle = -0.042 \pm 0.010 \quad (\sigma = 0.045)$$

# Power-2 law — model v. observations

*Kepler-17 is an outlier.  
Also the only star in the sample  
with clear star-spot activity.*

# Limb darkening in MURaM models

MURaM solar models, limb-darkening profiles at 611 nm for 0G and with faculae at 100G (Norris et al., 2017)  
*N.B. These models not suitable for calculating  $h_2$*

# Light curve models with power-2 limb-darkening

→ **elc**

→ *also does spots, Roche geometry, Doppler boosting, etc.*

→ **batman**

→ **pycheops**

→ *qpower2 algorithm*

# qpower2

- Fast power-2 light curve algorithm
- Based on Taylor series expansions of integrals
- Approximation
  - accurate to ~80ppm for  $R_{\text{planet}}/R_{\text{star}}=0.1$

```

39
```

# qpower2 - example

- CHEOPS band
- $R_{\text{star}}/a = 0.05$
- $R_{\text{planet}}/R_{\text{star}} = 0.1$
- $b = 0$
- $T_{\text{eff}} = 6000 \text{ K}$
- $\log g = 4.5$
- $[\text{Fe}/\text{H}] = 0$

STAGGER-grid profile, ell

power-2 limb darkening, ell

qpower-2 algorithm

# qpower2 performance — accuracy

CHEOPS bandpass,  $R_{\text{star}}/a = 0.05$ ,  $R_{\text{planet}}/R_{\text{star}} = 0.1$

Line	b
—	0.3
⋯	0.6
- - -	0.9

# qpower2 performance — speed

Execution time for transit with 3840 observations

Method	Time per model
1 CPU	357.0 $\mu$ s
8 CPUs	112.0 $\mu$ s
GPU Batch	13.2 $\mu$ s
GPU logL only	2.5 $\mu$ s

⇒ 1 million *log L* values per second on GPUs

# Conclusion

We should use the power-2 limb-darkening law to search for and to model transits in PLATO light curves of F/G/K-type dwarfs.
